REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: The prior art taken either singularly or in combination fails to anticipate or fairly suggest the limitations of the independent claim(s), in such a manner that a rejection under 35 U.S.C. 102 or 103 would be proper. The prior art fails to teach a combination of all the claimed features as presented in claim(s) 1-7, wherein a zoom lens barrel comprises a first, second and third lens group moving ring, all of which are linearly guided, a cam mechanism for moving the first lens group moving ring and the second lens group moving ring independent of each other, a biasing device for biasing the third group moving ring away from the first lens group moving ring, a linear guide through-slot, a first linear guide projection having a hanging groove formed along a substantially center thereof and a rear end of the hanging groove being closed, a second linear guide projection, a linear moving key projection, wherein a rear moving limit of the third lens moving group ring relative to the first lens group moving ring is determined by contact of the linear moving key with said closed rear end of the hanging groove, as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The following references are cited for being a related patent publication. The reference disclose at least a majority of the claim features, but none of them claim or are made obvious by the prior art to suggest a zoom lens barrel comprises a first, second and third lens group moving ring, all of which are linearly guided, a cam mechanism for moving the first lens group moving ring and the second lens group moving ring independent of each other, a biasing device for biasing the third group moving ring away from the first lens group moving ring, a linear guide through-slot, a first linear guide projection having a hanging groove formed along a substantially center thereof and a rear end of the hanging groove being closed, a second linear guide projection, a linear moving key projection, wherein a rear moving limit of the third lens moving group ring relative to the first lens group moving ring is determined by contact of the linear moving key with said closed rear end of the hanging groove, as claimed: Nomura et al.
